

Eye-Shield: Real-Time Protection of Mobile Device Screen Information from Shoulder Surfing

Brian Tang, Kang G. Shin

REAL-TIME COMPUTING LAB

ELECTRICAL ENGINEERING AND COMPUTER SCIENCE
@ UNIVERSITY OF MICHIGAN

What's Shoulder Surfing?

❖ Shoulder Surfing (Visual Hacking)

- Social engineering attack
- Pervasive, effective, low-budget

❖ Adversaries

- Mostly curious, sometimes malicious
- Use eyes, camera, binoculars, etc.

Shoulder Surfing in the News

❖ PIN-Stealing

- Phone access, personal information
- Thief stole £22k
- Can successfully obtain 6-digit PIN with just one glance 10.8% of the time [Aviv et al.]

❖ Users only aware of 7% of shoulder surfing instances [Eiband et al.]

❖ 85% of shoulder surfers observed sensitive or private information [Honan et al.]

Threat Model

- ❖ Users want: Security, privacy, usability
- ❖ Adversary: Obtain information from victim's device screen without getting noticed
 - ❖ Resources: eyes, phone camera, quick glances, longer stares

A Key Research Question

- ❖ How do we protect users from shoulder surfing?

Privacy film

Privacy Films

❖ Advantages

- Pervasive
- Darkens the screen
- Little to no usability cost

❖ Drawbacks

- Protects only at angles $>30-45^\circ$
- Added cost (\$7-30)
- Requires (re)installation when switching device
- Not easily “deactivated”
- Incompatible with other screen protectors or matte/antiglare addons
- Annoying to install or use in private settings
- Does not protect landscape view

A Key Research Question

- ❖ How can we build a shoulder surfing protection mechanism for mobile devices?
- ❖ In a manner that addresses most of the limitations of privacy films
- ❖ Solution: Eye-Shield

(Only \$49.99)

A Key Research Question

❖ How can we build shoulder surfing protection into mobile devices?

❖ In a manner that is:

- Lightweight
- Continually active
- Protects information on the entire screen
- Little impediment on the user's tasks

Our Solution: Eye-Shield

Protects on-screen information by making it appear blurry at a distance/angle.

Advantages:

- ❖ Easy to use
- ❖ Real-time operation
- ❖ Acceptable CPU, energy and memory usage
- ❖ Free & built-in!

Original, unprotected screen

Protected screen with Eye-Shield

Design - Grids

❖ Resolving Power

- $\theta = 1.22\lambda / D$
- Observation from HideScreen (Chen et al.)

Design - Blurred Target

- ❖ Use blurred version of original image
 - Design checkered grid such that colors average out to be a blurred version.

Design - Overview

1. Blur/pixelate image
2. Generate grid of image size
3. Run Eye-Shield algorithm

Algorithm 1

Where img is the original $w \times h \times 3$ image where $grid$ is a $w \times h$ checkered grid of 1s and 0s where $targ$ is the $w \times h \times 3$ image, blurred or pixelated

```
1: procedure EYE-SHIELD ALGORITHM( $img$ ,  $grid$ ,  $targ$ )  
2:    $complement = (targ^2 * 2) - img^2$   
3:    $delta = (complement - img^2) * grid$   
4:    $newimg = \sqrt{img^2 + delta}$   
5:    $clip(newimg, 0, 255)$ 
```

Recorded Demos

Evaluation

- ❖ Protection Efficacy
- ❖ Performance
- ❖ Usability

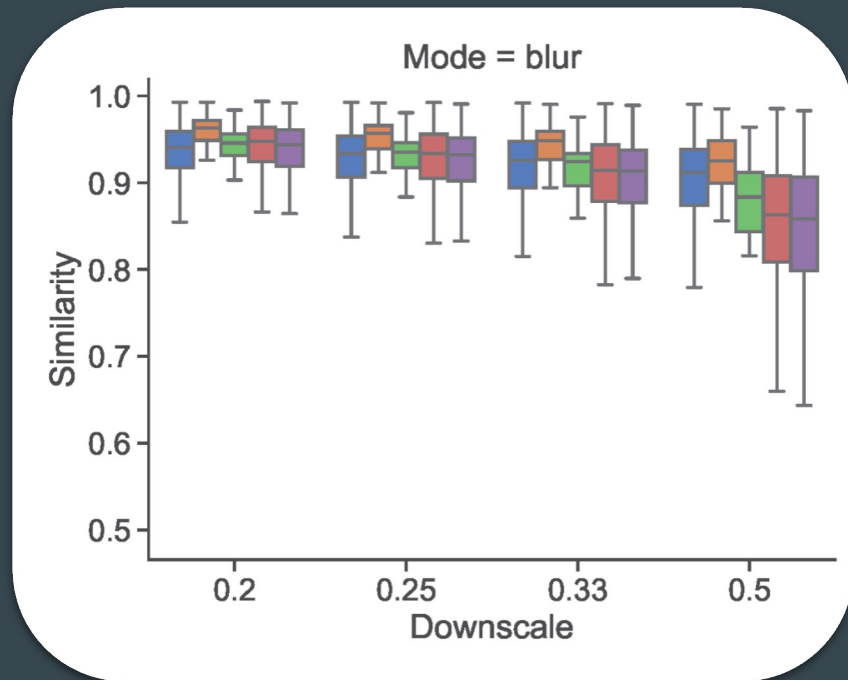

Evaluation - Efficacy (SSIM)

❖ SSIM (0 - low similarity, 1 - high similarity)

- SSIM > 0.9, Eye-Shield mimics blurred images
- The further the screen, the more Eye-Shield mimics blurred images

❖ Evaluated image datasets

High Resolution Images	Mobile App UIs	Video Datasets (# Frames)
900	1460	1522

Evaluation - Performance

Latency

Resolution	Android (FPS)	iOS (FPS)
1920×1080	49.25	91.39
1080×2400	39.20	74.29
1170×2532	34.52	64.95
2560×1440	29.27	51.95
1440×3088	23.95	43.05

Mobile Performance
Benchmarks

High performance at high
resolutions

Evaluation - Performance

- ❖ Power: Low or Medium rating on most resolutions
- ❖ Memory: < 40 MB
- ❖ CPU Utilization: < 10%

Acceptable energy and resource consumption

Methodology - User Study

❖ In-Person Study (IRB Exempt)

- 22 U.S. participants
- Diversity in age, occupation, ethnicity, and gender
- Brightly lit lab with device brightness at 66%
- 6 images, 2 videos, 7 mobile app UIs, 2 screen recordings
- Evaluation in 6 settings (in order)
 - Shoulder surfer (41", 20" and 45°, with film + Eye-Shield)
 - Intended user 10" away (with protection)
 - Shoulder surfer without protection (41", 20" and 45°)

User Study - Examples

- ❖ What is the current high and low temperature?
- ❖ Can you read the first word in each sentence?
- ❖ Can you describe the displayed image?

User Study - Efficacy (In Person)

**Protects information
without harming
intended user's
reading/viewing**

Acronym	Meaning
IU	Intended User (10")
SS	Shoulder Surfer (41" or 20"+45°)
GT	Ground Truth (Unprotected)

User Study - Usability

❖ SUS score 68.86

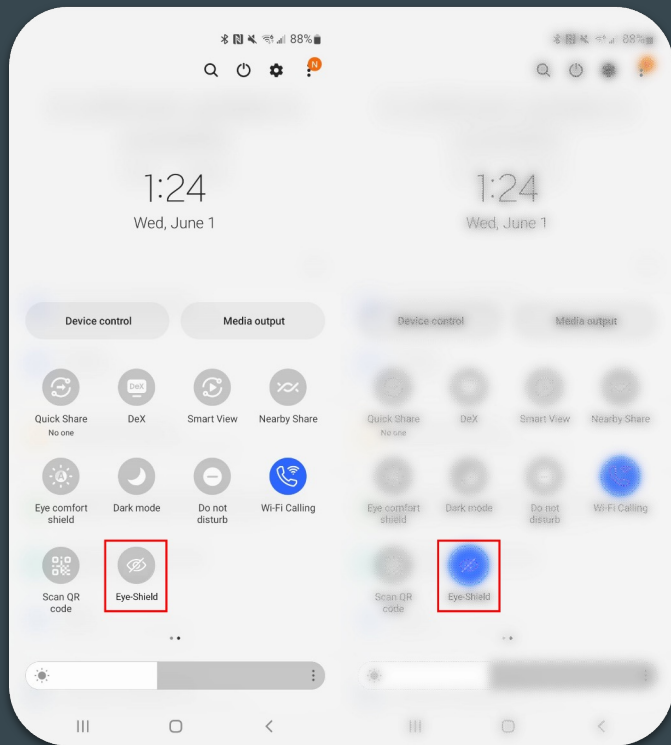

- About average usability
- Cutoff range = 68

❖ Observations

- Sometimes referable to privacy film
- Indicated that a toggle widget or brightness meter would be best
- Minor eye strain after shoulder surfing for 1 hour

User Study - UI Prototypes

User Study - Privacy Films

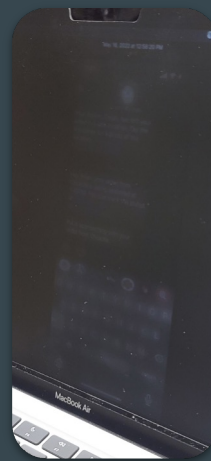

- ❖ Privacy film only
 - Narrow protection angle
- ❖ Both privacy film and Eye-Shield
 - Better protection guarantees

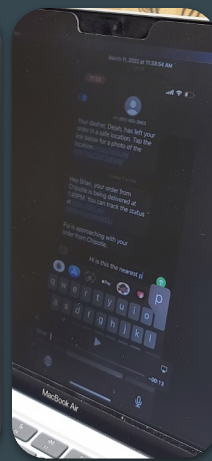

Both

Privacy Film

Both

Privacy Film

Thank you to the ARO for supporting this project

Thanks to the RTCL members and shepherds for helping me with the user study!

Conclusion

Takeaways:

- ❖ Shoulder surfing poses a significant threat to mobile security and privacy
- ❖ **Eye-Shield** can prevent many details of on-screen information from being leaked to shoulder surfers
- ❖ Thorough evaluations of Eye-Shield's efficacy, performance, and usability demonstrate its usefulness
